SNOW SURVEYS and WATER SUPPLY OUTLOOK for ALASKA

U. S. DEPARTMENT of AGRICULTURE ★ SOIL CONSERVATION SERVICE

Collaborating with

ALASKA SOIL CONSERVATION DISTRICT

Data included in this report were obtained by the agencies named above in cooperation with Federal, State and private organizations listed inside the back cover of this report.

AS OF
APR. 1, 1974

TO RECIPIENTS OF WATER SUPPLY OUTLOOK REPORTS:

Most of the usable water in western states originates as mountain snowfall. This snowfall accumulates during the winter and spring, several months before the snow melts and appears as streamflow. Since the runoff from precipitation as snow is delayed, estimates of snowmelt runoff can be made well in advance of its occurrence. Streamflow forecasts published in this report are based principally on measurement of the water equivalent of the mountain snowpack.

Forecasts become more accurate as more of the data affecting runoff are measured. All forecasts assume that climatic factors during the remainder of the snow accumulation and melt season will interact with a resultant average effect on runoff. Early season forecasts are therefore subject to a greater change than those made on later dates.

The snow course measurement is obtained by sampling snow depth and water equivalent at surveyed and marked locations in mountain areas. A total of about ten samples are taken at each location. The average of these are reported as snow depth and water equivalent. These measurements are repeated in the same location near the same dates each year.

Snow surveys are made monthly or semi-monthly from January 1 through June 1 in most states. There are about 1900 snow courses in Western United States and in the Columbia Basin in British Columbia. Networks of automatic snow water equivalent and related data sensing devices, along with radio telemetry are expanding and will provide a continuous record of snow water and other parameters at key locations.

Detailed data on snow course and soil moisture measurements are presented in state and local reports. Other data on reservoir storage, summaries of precipitation, current streamflow, and soil moisture conditions at valley elevations are also included. The report for Western United States presents a broad picture of water supply outlook conditions, including selected streamflow forecasts, summary of snow accumulation to date, and storage in larger reservoirs.

Snow survey and soil moisture data for the period of record are published by the Soil Conservation Service by states about every five years. Data for the current year is summarized in a West-wide basic data summary and published about October 1 of each year.

PUBLISHED BY SOIL CONSERVATION SERVICE

The Soil Conservation Service publishes reports following the principal snow survey dates from January 1 through June 1 in cooperation with state water administrators, agricultural experiment stations and others. Copies of the reports for Western United States and all state reports may be obtained from Soil Conservation Service, Western Regional Technical Service Center, Room 209, 511 N. W. Broadway, Portland, Oregon 97209.

Copies of state and local reports may also be obtained from state offices of the Soil Conservation Service in the following states:

STATE	ADDRESS
Alaska	204 E. 5th. Ave., Room 217, Anchorage, Alaska 99501
Arizona	6029 Federal Building, Phoenix, Arizona 85025
Colorado (N. Mex.)	P. O. Box 17107, Denver, Colorado 80217
Idaho	Room 345, 304 N. 8th. St., Boise, Idaho 83702

ALASKA SUMMARY
as of
APRIL 1, 1974

Surveys just completed indicate that most watersheds monitored by the program still have below normal snowpacks, with some areas extremely short of snow.

March snowfall was lighter than average over most of these watersheds. In addition, the early melting of some low elevation snow has further reduced the pack.

Forecasts of spring and summer snowmelt runoff in the Fairbanks and Anchorage areas have been lowered slightly due to the lack of March precipitation.

The area by area summary is as follows:

KOYUKUK DRAINAGE

The shortage on the Koyukuk is severe, with only half of normal on the ground on April 1. Unless summer rains are heavier than normal, river flows will be quite low and lake levels will drop.

UPPER YUKON DRAINAGES

The basin-wide snow cover is still much below normal. The situation has not changed during the last month. The current snowpack is 30 percent below average.

KUSKOKWIM DRAINAGE

The few data sites on the upper reaches of the Kuskokwim indicate that the pack is still much below average. Only two-thirds of the normal accumulation was measured on April 1.

TANANA-CHENA DRAINAGES

Less than normal snow was received at higher elevations of the watersheds during March. The pack is now 23 percent below normal. The Chena and Salcha rivers are now forecast to yield 83 and 82 percent of their normal spring and summer runoff, respectively.

COPPER DRAINAGE

This is one area that has shown steady improvement since February 1. The basin-wide pack is now only seven percent below the April 1 normal.

MATANUSKA-SUSITNA DRAINAGES

Snowfall was below normal during March. As a result the snowpack is now only 82 percent of the April 1 average. The current accumulation is only three-fourths of last year's level.

UPPER COOK INLET DRAINAGES

Little moisture was received over most of this area. At lower elevations the pack has already begun to melt. The result is that the snowpack is now 27 percent below the April 1 normal. Ship and South Fork of Campbell Creeks runoff forecasts have been revised downward slightly to 87 and 84 percent of average, respectively.

KENAI PENINSULA

The lower elevation snowpack is melting. As a result, the remaining pack is about the same as one year ago and about 10 percent heavier than the short-term average.

SOUTHEASTERN DRAINAGES

Ketchikan area snow courses have about the same snow cover now as last year. Near Juneau the cover is slightly above average, but ten percent less than last year.

LEGEND

- * Numerals 1,2,3,4,5, and 6 refer to January 1, February 1, March 1, April 1, May 1, June 1, and 7 - for special dates.
- * Letters refer to Agency that secures the snow survey, as follows:
 - a. Soil Conservation Service
 - b. Forest Service
 - c. U. S. Army Corps of Engineers
 - d. U. S. Army Cold Regions Research & Eng. Lab
 - e. Alaska Power Administration
 - f. Bureau of Land Management
 - g. U. S. Geological Survey
- * Letters following the snow course no. refer to:
 - * A. Snow course and aerial stadia marker
 - * a. Aerial stadia marker only
 - M. Soil Moisture Station
 - P. Precipitation Storage Gage
 - S. Snow Pillow
